**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

# ESTABLISHMENT OF CRACK INDEXES BY ELECTRICAL APPARENT RESISTIVITY DATA

Soil cracks, whose formation are associated to natural climate phenomena, play an important role in water and gas transfer. Detecting cracks by non-destructive geophysical methods permits a 3D temporal monitoring of the cracking patterns. Electrical resistivity is indeed well adapted to recognize the electrical resistant signature of crack filled by air during a dessiccation period.

The experimentation was conducted on a soil block ( $x = 0.26$  m,  $y = 0.30$  m,  $z = 0.40$  m), where the cracking pattern resulted of natural dessiccation phenomena during 18 days. We proposed to use a square array device in two orientation  $0^\circ$  and  $90^\circ$ . Indeed in heterogeneous medium, like cracking soil, electrical measurement is sensitive to electrode configuration. The inter-electrode spacing was 0.03 m. The interpretation of the apparent resistivity measurement led to develop two anisotropic indexes AAI and  $\alpha_{max}$ .

At the final stage the  $\alpha_{max}$  distribution was in good agreement with the soil cracking surface analysis. Three major cracks spreaded out at depth with the same orientation. The AAI index was also correlated with the position of the cracks. Positive AAI values were related with cracks preferentially oriented at  $90^\circ$ , and negative values were related to crack preferentially oriented at  $0^\circ$ . The temporal monitoring showed that for the three major crack, the  $\alpha_{max}$  index did not change with time, whereas the AAI index exhibited variations during the monitoring time.

By way of numerical simulation, the sensitivity of these two indexes to parameters describing the cracks geometry was tested. The  $\alpha_{max}$  index was correlated with the

crack orientation in the Oxy plan; the AAI index was also sensitive to the width, the depth, and the pitch of the crack. The peak of AAI value observed at the 6th day was related to a variation of the pitch of the crack. These two indexes provided useful and not redundant information for the cracking pattern interpretation.
