HAL is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

AGU FALL MEETING

TEMPERATURE - KEY PARAMETER TO UNDERSTAND LAVA FLOW RHEOLOGY

Lava flow T retrieved by remote sensing (RS) depends on spectral emissivity (ε).

ε poorly known: considered constant or retrieved at RT

Only few studies of ε at relevant magmatic conditions:

- Limited T range ($<T_g$) / spectral range (TIR)/ composition (synthetic)

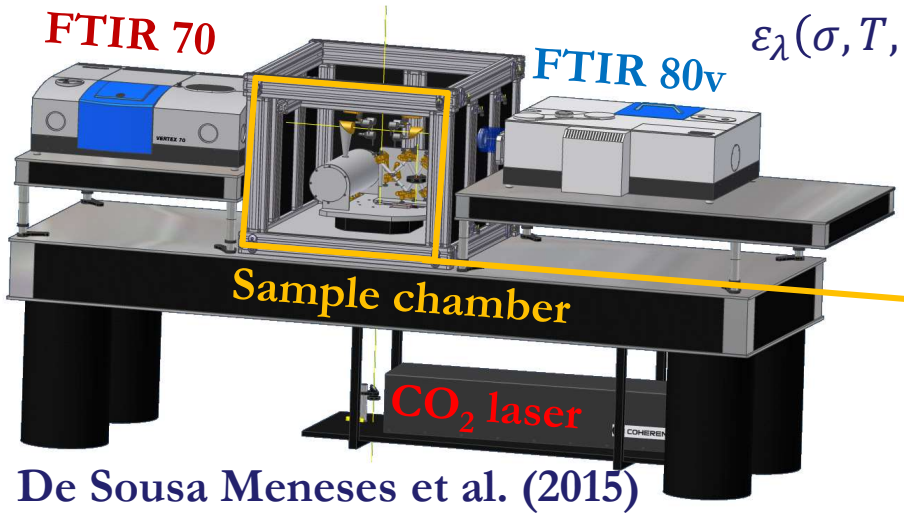

High Temperature and broad spectral range ε data are necessary!

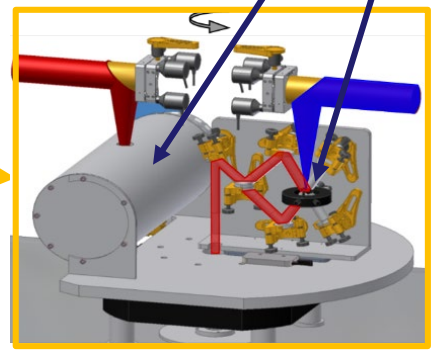

$$\varepsilon_\lambda(\sigma,T,\theta) = \frac{L_\lambda(\sigma,T,\theta)}{L^0_\lambda(\sigma,T,\theta)} = \frac{Sample}{BB}$$

In situ measurements of ε with FTIR spectrometers up to 1800 K, in SWIR-MIR-TIR

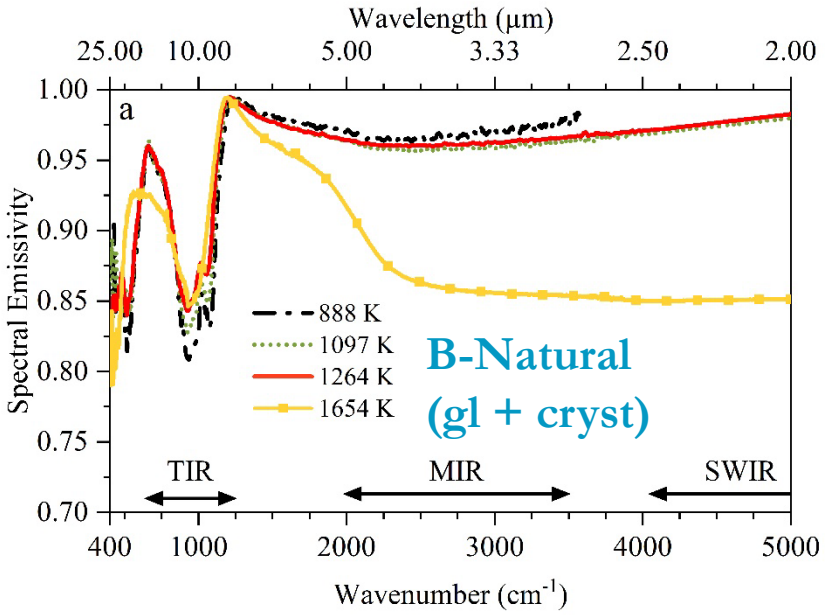

De Sousa Meneses et al. (2015)

SPECTRAL EMISSIVITY BEHAVIOR OF BASALT WITH CRYSTALS

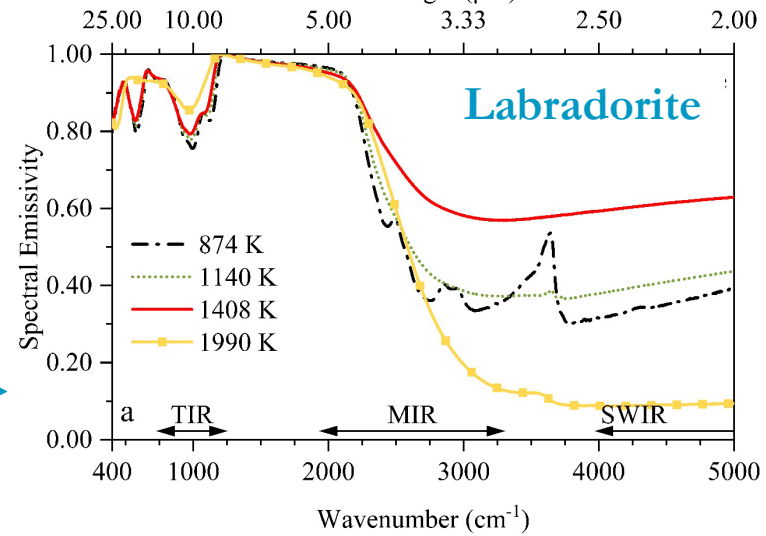

=

+

- ε increases linearly with T in TIR
- ε changes non-linearly with T in SWIR, MIR
- ε highly impacted by crystals content, composition

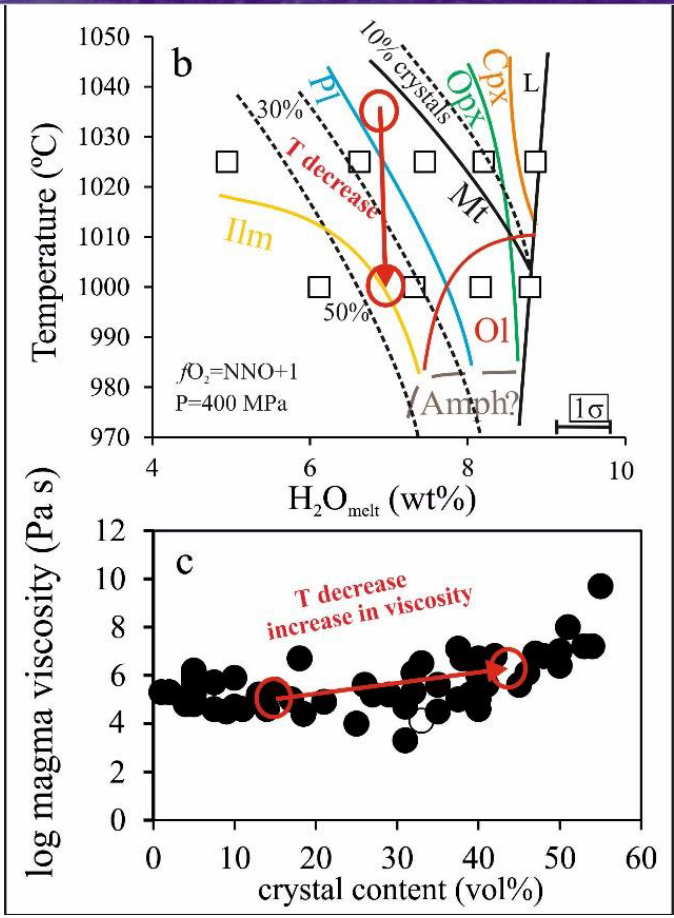

ESSOAr | https://doi.org/10.1002/essoar.10509907.1 | CC_BY_4.0 | First posted online: Wed, 29 Dec 2021 09:10:54 | This content has not been peer reviewed.

AGU FALL MEETING

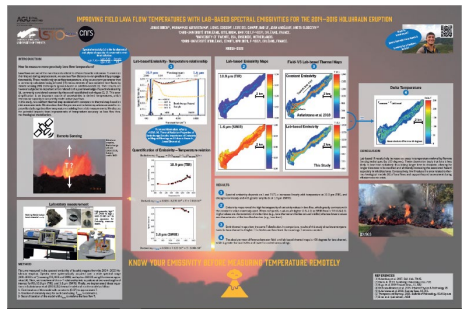

IMPLICATION

Andújar and Scalliet (2012)

- ε behavior is highly complex
  - depends on λ, T, composition, and crystal content
- Better constrain on surface radiance
  - Refine T by ~50 degrees with RS
- More appropriate rheological evolution
  - lava flow behavior: from liquidus to subsolidus
- Reduce uncertainty in lava flow modeling
  - improve hazard assessment
