**HAL** is a multi-disciplinary open access archive for the deposit and dissemination of scientific research documents, whether they are published or not. The documents may come from teaching and research institutions in France or abroad, or from public or private research centers.

L'archive ouverte pluridisciplinaire **HAL**, est destinée au dépôt et à la diffusion de documents scientifiques de niveau recherche, publiés ou non, émanant des établissements d'enseignement et de recherche français ou étrangers, des laboratoires publics ou privés.

**Key words.** techniques: high angular resolution – methods: observational – stars: AGB and post-AGB – circumstellar matter – stars: evolution – errata, addenda

It has come to our attention that further clarification is needed with respect to Fig. 2 and Sect. 3.1 in the original published version of this article (Lykou et al. 2015). The correction is related to a citation made in Sect. 3.1 to the work of Meisner (2008) and the method used to derive the angular sizes presented in Fig. 2, which may confuse the reader. Our results, as presented in Fig. 2 and Sect. 3.1, were derived with a method independent of the one of Meisner (2008). The citation should be modified to J. Meisner (priv. comm.). This clarification does not modify the overall direction of our work.

*Acknowledgements.* We thank Dr. Jeff Meisner for pointing out this inconsistency, for many fruitful discussions on optical interferometry and for providing the reduced VINCI visibilities.
